Color drawings are necessary in this application for the following reasons. All of the drawings being submitted as part of this application are fluorogram traces generated by software specifically designed to render data from an automated DNA sequencing instrument, specifically ABI Prism Sequencing Analysis Software version 5.0 (Applied Biosystems Inc., Foster City, CA). These fluorogram traces present four different color waveforms corresponding to the four different nucleotide bases in DNA, each of which is labeled with a different color fluorescent dye, enabling the sequencing instrument to differentiate between them. The four waveforms are presented in overlapping format, making it very difficult for one to distinguish the different waveforms in a black and white form.

In addition to the waveforms, the software output includes a bar graph representation of a statistical parameter designed to assess the level of confidence attached to each nucleotide base in the sequence. These bar graphs are also rendered in the same four colors, each representing a different nucleotide base. Although a black and white rendering of these bar graphs enables one to see the relative level of confidence attached to a particular nucleotide base, it does not enable one to get a picture of the overall relative nucleotide base composition of the entire DNA being sequenced. Only a color rendering provides this additional and important level of information.

The specification of the application includes the language required under 37 CFR 1.84(a)(2)(iv).
